SOUND SEALING

EMSEAL's double-sided Seismic Colorseal-DS movement joint sealant fills and seals both interior and exterior structural joint openings while simultaneously insulating and attenuating sound. It is ideal for new or retrofit use and features noninvasive anchoring: No screws, anchors, or embedments are used to hold system in place or exact a seal. Material self-expands and connects to substrates through its inherent, active backpressure combined with the pressure-sensitive-adhesive nature of the impregnation medium in the cellular foam matrix.
